

Attn: Mr. Leonard Warren at Techline Coatings

Hello Leonard. This is Tapio Niivila from Ride Concepts Inc.

We are a motocross suspension modification shop located in the center of Canada. In our industry, performance coatings are quite normal. Currently the best performing anodic coatings available are Kashima Coat and standard issue Hard Anodize. These coatings are used on suspension components with the intent to increase the suspension's performance by decreasing friction between the moving parts.

I had a set of outer fork tubes for my own personal motocross bike coated with your coloured Diamondyze coating from Hupe Manufacturing.

I am writing you this to let you know that the outcome was very successful.

We are very impressed with this product!

The suspension had an immediately noticeable decrease in initial static friction.

This resulted in an increase in compliance and overall suspension performance.

An improvement on hard landings with these coated outer fork tubes was also noted. This improvement is from the decrease in the sliding friction between the fork bushings and the flexing outer fork tube during hard use.

I inspected these parts after a fair bit of use, and there was no measurable or visual wear.

After testing the Diamondyze coating on my personal bike, I am convinced that this product will be more beneficial to our customers than what is currently available.

I am now offering this performance enhancing coating to our customers on motorcycle and snowmobile suspension.

Thank you for the incredible product.

Best regards,
Tapio Niivila
President
Ride Concepts Inc.
